

VENTURA SECURITIES

How does Ventura Work?

How It Works:

1. User Lands on Ventura via a Campaign URL

The URL contains UTM parameters like:
million-traffic-pricing-google-discovery-ads-age25-34

2. User Submits Mobile Number

- Once a number is entered and submitted, a Lead-ID is generated.
- Ventura captures this UTM metadata along with the user's mobile number and stores it in the database.

3. Multiple Interactions Possible

- If the same mobile number reinitiates a journey from another campaign, the same Lead-ID is reused, but with updated UTM metadata captured as a new UTM record.
- Therefore, a single Lead-ID can be linked to multiple UTM-IDs, representing different stages or sources of acquisition.

4. Direct Installs & SDK Attribution

- If a user installs the app directly from the Play Store (without a campaign link), the UTM fields default to 'Direct'.
- To handle such cases, Ventura uses a third-party SDK (Singular) to track user acquisition events even post-install.
 - Singular integrates with platforms like Google Ads, Meta, and others, helping Ventura retrospectively identify the source/campaign for these leads.

5. Data Entry & Tracking Points

- Lead-ID is created after mobile number submission (not just page visit).
- UTM-ID is used to track each unique set of UTM values tied to a Lead-ID

Tables we are provided:

1. UTM –DETAILS

The data captures UTM parameters tied to individual leads, helping track how users reached the platform (e.g., via Google ads, direct visits, or partner programs). utm parameters works behind the domain url.

2. Client Onboarding

The onboarding data represents the step-by-step journey of a user during digital account registration or verification within a system. Each record in the data logs a specific action or event (e.g., sending OTP, verifying email), whether it was initiated by the user or system, and how it was handled in both mobile and web applications.

3. Client State Mgmt

The Client Mgmt data represents the backend tracking and control of client onboarding states during registration or verification. It defines how each event is recorded, labelled, and managed by the system to ensure a smooth user journey

UTM –DETAILS		
Parameter	Description	Remarks
1. Utm-id	Utm-id is a variable for numbering and managing client's own database.	Used for indexing and managing UTM records in the client's system.
2. LEAD-id	It is a unique identifier which is created when a user submits their mobile number on the platform	Remains consistent across re-visits by the same mobile number
3. Utm-source	It refers to the platform or source from where the user arrived.	Examples: Google, Facebook, direct referral
4. Utm_medium	It identifies the type of marketing channel through which the user accessed the site.	Examples: cpc, email, WhatsApp, social, direct
5. Utm_campaign	It indicates the specific campaign that led the user to the platform	
6. Utm_content	It describes the specific creative or ad clicked by the user.	
7. Utm_term	It describes a certain period of time within the campaign has been run	
8. Utm_rne	It flags whether the lead came from the "Refer & Earn" program.	Defaults to <code>DIRECT</code> if the source isn't from a referral.
9. Utm_vppcode	The code which tells us that which partner generated the lead	
10. Utm_vppsourc	Sub Sources under vppcode to further narrow down (eg. Area wise, agent wise)	Eg. Under vppcode 1 there may be 5 vppsourc
11. Utm_cta	Tells the state of user on Call-To-Action button which is clicked by user on the Ventura platform	(e.g., <code>Login</code> , <code>FundNow</code>). By default value 'Direct' is passed
12. Created_dttm	When user completed the process and all utm parameters are captured	Helps with time-based filtering, lead funnel tracking, and campaign analysis.

	then the time at which the data point is created.	
13. Last State Id	Unclear	No information provided
14. Resume State ID	Unclear	No information provided

<i>Client Onboarding</i>		
Parameter	Description	Remarks
1. Client Detail ID Incr	It is an Identifier for customer detail record	It Serves as a reference/foreign key. It is linked to other internal tables
2. Session Details Id	ID for a particular user session	It comes into the picture during pre-login part of user journey
3. Client Id	It is generated after successful e-signup process completion. A client id is associated with a lead id.	If missing, the user hasn't completed account opening. It is generated when user completes all the login steps. A client id is generated corresponding to a lead id. (Confirmation required)
4. Salutation	Formal title used for the user (e.g., Mr., Ms., Dr.).	We may address gender by this parameter if necessary.
5. First Name , Last Name, Middle Name	User's first name , User's Last name, User's Middle name respectively	It is a part of personal identification data. User has to fill the first name. Similar works for last name, Middle name.
6. Phone number	Mobile number which user enters during login	Used for otp and communication
7. Email id	User's email address	It is also used for communication and updates
8. Dob	Date of birth entered by user during login	It is used during kyc process
9. Gender	Male/Female	Will be effective in population based segmentation
10. Pan No	Permanent account number of user	Pan no. is used in KYC and account opening journey
11. Pan Login Attempt	# of times pan number has been used for login	
12. Pan Father name	Father's name of the user as per pan card	
13. Marital Status	User's marital status	Married / Unmarried
14. Income range	User fills the income bracket in which he lies during account opening journey	Below 1 lakh ,1-5 Lakh ,5 – 10 Lakh 10-25 Lakh , Above 25 Lakh
15. Occupation	User selects his/ her profession or employment status	Agriculturist/Business /GovtServices/Housewife..etc

16. Residential Status	Whether the client is a resident, non-resident, or NRI.	
17. Residency Country	Country where the user resides	
18. Tax Residency Country	Country where the user files taxes.	
19. Political Exposed Status	User is politically exposed or not.	Values : Yes/No
20. Is Client Minor	It indicates whether the client is a minor or not.	
21. Account Type	Type of account user is having	E.g., individual, joint, corporate;
22. Client Mgmt ID	It represents the user onboarding stages. This id tracks how many steps have been passed by user. It refers to different process checkpoints (~1900 stages) in on boarding.	Each ID denotes a specific step in the client journey.
23. Is Existing Client	It checks whether the user is a new user or already exists?	True or False as value
24. Is WhatsApp Enabled	Boolean flag which shows that if the client opted in WhatsApp communication or not.	True or False as value
25. Is Aadhar Linked PAN	It Indicates whether Aadhar is linked to Pan or not	True or False as value
26. Is FATCA Verified	It tells whether the FATCA form has been submitted by user or not	True or False as value
27. Is KYC Compliant	It indicates SEBI-mandated KYC is completed or not by user	True or False as value
28. Is KRA Verified	It tells the KRA (karvi agency) has verified user details or not	True or False as value
29. Is Bank Verified	Confirms whether bank account has been verified or not by system	True or False as value
30. Created By	No info	No info
31. Created timestamps	Timestamp when the customer record was first created.	It may be used for time-based filtering or tracking.
32. Updated By	No info	No info
33. Updated Timestamp	Timestamp of last update to the record.	
34. Is Gmail Verified	Indicates if Gmail ID is verified or not.	True or False as value
35. Is True caller Verified	Indicates if mobile number is verified via True caller or not	True or False as value

36. Trading Experience ID	It is an id which represents how many years of experience user having in trading. It is filled by user	(mapping data required) for New Investor, <1 year, 1-2 Year ,2-5 Year,5-10 Year, 10-20 Year,20-25 Year, 25+ Years
37. Drop-off Email Dttm	No info	Re-question required
38. Penny drop Attempt	Number of times penny drop verification (account verification process by adding an amount to the account for verification) was attempted by user	System calculated Data
39. Form No	No info	Re-question required
40. Mitc (Mandatory Investor Terms and Conditions)	Checks that mitc has been acknowledged or not. (SEBI – guidelines)	True /False - System calculated Data
41. DDpi (Demat Debit and Pledge Instruction)	Checks that ddpi approved or not.	True / False - System calculated Data
42. Mitc Dttm	Time when MITC form is submitted	
43. Ddpi Dttm	Time when DDPI form is submitted	
44. Platform	It Indicates final on-boarding platform used by user.	Eg. (web or app).
45. OCR Push Status	It tells about the status of data push to backend OCR system or not. If all the steps are completed only then data is pushed into the OCR	Eg. Pending , success
46. KRA	Tells that KRA (KYC registration agency) verification is successful or not	Eg. True, False Data is system calculated
47. ITD	No info	Re-question required
48. Adv. Device ID	Device ID used by the user during on-boarding journey	Require the device id mapping table
49. Name	No clear info	Re-questioning required
50. MTF	User has opted for (margin trading facility) or not.	True / False
51. MTF Dttm	Timestamp when user selected MTF option.	

Client State Mgmt		
Parameter	Description	Remark
1. Client Mgmt ID Incr	Incremental ID used to track the order of client actions.	
2. Client Mgmt State	System label or name representing the specific client interaction stage	Eg. user clicks on resend otp email option again

3. Client State Desc	Human-readable explanation of the user/system action at that stage	
4. Is Active	The user management state is active or not	True/False
5. Mobile Route	Internal route in the mobile application corresponding to the current state.	Eg. If the system makes some stage as inactive then it would be False. Handled by system
6. Web Route	Internal web route URL for handling that on-boarding state.	Re-question may required
7. Consolidated State	No clear info	Re-question required
